GENERAL COMMENTS AND DISCLAIMER:
This survey has been compiled using a combination of conventional and UG Service Detection survey techniques.

The survey from which this model was created was carried out to comply with the requirements of the client as set out in the scope of works contained in the survey instructions for this project. Anybody who uses this survey for any purpose other than that for which it was carried out does so at his or her own risk.

Any public utilities and services shown in this model have been located by using visible surface features and underground service detection techniques.

Please note that not all buried pipes, cables and ducts can be detected and mapped in consideration of their depth, location, material type, geology and proximity to other utilities. Even an appropriate and professionally executed survey may not be able to achieve a 100% detection rate.

Property boundary overlays, where supplied, vary in accuracy but are generally to 0.5m. Therefore a Land Survey, as defined under the Surveying Act 2002, should be undertaken before any construction activity is carried out on or near the land boundaries depicted by this model.

Survey control information is regarded as suitable for the survey and correct at the time of survey, but should be verified before being used for any purpose.

QUALITY LEVELS: Subsurface Utility Information (SUI)

QL-D: Quality level D is the lowest of the four quality levels. The attribute information and metadata of a subsurface utility shall be compiled from existing records, cursory site inspection and/or oral recollection.

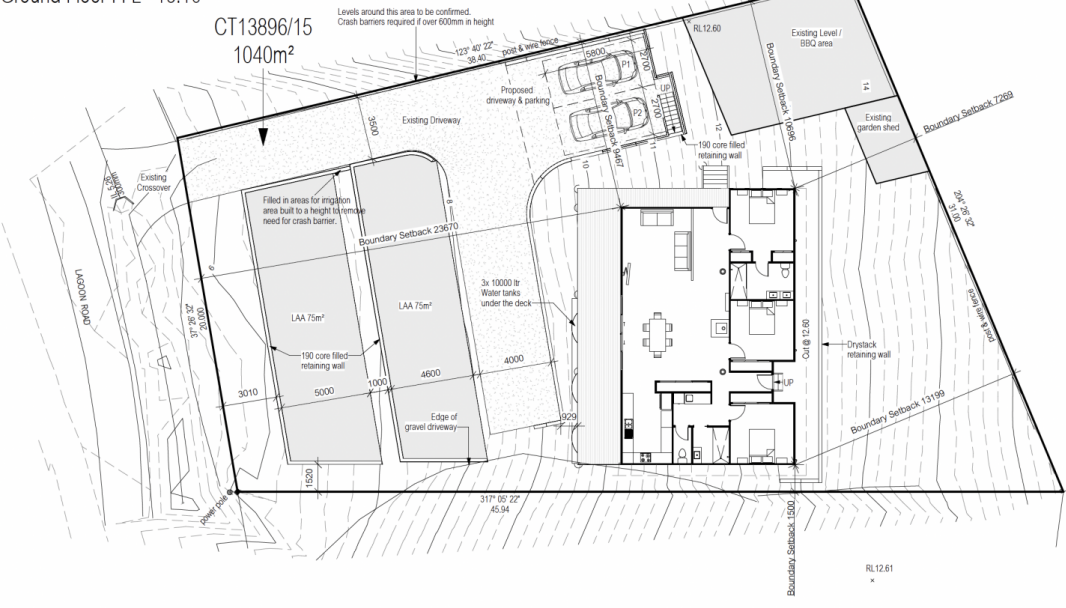

QL-C: Quality level C is described as a surface feature correlation or an interpretation of the approximate location and attributes of a subsurface utility asset using a combination of existing records (and/or oral recollection) and a site survey of visible evidence.

QL-B: Quality level B provides relative subsurface feature location in three dimensions.

QL-A: Quality level A is the highest quality level and consists of the positive identification of the attribute and location of a subsurface utility to an absolute accuracy in three dimensions. It is the only quality level that defines a subsurface utility as 'validated'.
